1.5.2. Popularity Method	9

1. Spotify Music Analysis Report

1.1. Data Collection and Loading

First, the following R libraries were installed and loaded :

```
library(readr)
library(dplyr)
library(tidytext)
library(stringr)
library(tm)
library(ggplot2)
library(wordcloud)
library(RColorBrewer)
```

The dataset used for this analysis was downloaded from Kaggle and saved as `Spotify-Dataset.csv`.

1.2. Data Preprocessing

- **Loading Data:** The dataset `Spotify-Dataset.csv` was loaded into R.
- **Data Cleaning:** Checked for duplicate rows with `any(duplicated(spotify_data))`. Missing values were evaluated by examining the popularity column and its computed mean. If there were any missing values, running `mean(spotify_data$popularity)` would return NA.
- **Descriptive Statistics:** Computed the mean values for key variables : Popularity, duration in milliseconds, danceability, energy, and tempo, which all returned a positive number meaning no values were missed.

```
Mean Popularity: 33.23854
> cat("Mean Duration (ms):", mean(spotify_data$duration_ms)) #mean duration (ms)
Mean Duration (ms): 228029.2
> cat("Mean Danceability:", mean(spotify_data$danceability)) #mean danceability
Mean Danceability: 0.5668001
> cat("Mean Energy:", mean(spotify_data$energy)) #mean energy
Mean Energy: 0.6413828
> cat("Mean Tempo:", mean(spotify_data$tempo)) #mean tempo
Mean Tempo: 122.1478
```

Also, `cor(spotify_data$numerical_feature_1, spotify_data$numerical_feature_2)` will give us the correlation coefficient between the two specified numerical variables. It ranges from -1 to 1:

+1: Perfect positive correlation. As one variable increases, the other also increases proportionally.

-1: Perfect negative correlation. As one variable increases, the other decreases proportionally.

0: No linear correlation. Changes in one variable do not predict changes in the other.

```
> cor(spotify_data$danceability, spotify_data$popularity)
[1] 0.03544813
> cor(spotify_data$duration_ms, spotify_data$energy)
[1] 0.05852278
> cor(spotify_data$energy, spotify_data$danceability)
[1] 0.1343255
> cor(spotify_data$tempo, spotify_data$duration_ms)
[1] 0.02434561
```

1.3. Data Analysis

1.3.1. Top 10 Popular Songs

The entire dataset is arranged in descending order by the popularity column. The most popular songs will come first. We select only the relevant columns: `track_name`, `artists`, and `popularity` as they are the only the necessary information for analysis.

```
[1] "Top 10 Songs by Average Popularity:"
> print(top_songs)
# A tibble: 10 × 3
  track_name                artists                popularity
  <chr>                    <chr>                    <dbl>
1 Unholy (feat. Kim Petras) Sam Smith;Kim Petras      100
2 Unholy (feat. Kim Petras) Sam Smith;Kim Petras      100
3 Quevedo: Bzrp Music Sessions, Vol. 52 Bizarrap;Quevedo          99
4 I'm Good (Blue)         David Guetta;Bebe Rexha    98
5 I'm Good (Blue)         David Guetta;Bebe Rexha    98
6 La Bachata              Manuel Turizo               98
7 La Bachata              Manuel Turizo               98
8 I'm Good (Blue)         David Guetta;Bebe Rexha    98
9 La Bachata              Manuel Turizo               98
10 La Bachata              Manuel Turizo               98
```

1.3.2. Top 10 Artists

Groups the data by `artists`. We compute the average popularity score for all songs by each artist and sort the summarized data by average popularity in descending order, so the most popular artists are at the top.

```
[1] "Top 10 Artists by Average Popularity:"
> print(top_artists)
# A tibble: 10 × 3
  artists                mean_popularity song_count
  <chr>                    <dbl>         <int>
1 Sam Smith;Kim Petras      100             2
2 Bizarrap;Quevedo          99             1
3 Manuel Turizo             98             4
4 Bad Bunny;Chencho Corleone 97             4
5 Bad Bunny;Bomba Estéreo    94.5           4
6 Joji                     94             1
7 Beyoncé                  93             1
8 Harry Styles              92             3
9 Rema;Selena Gomez         92             1
10 Drake;21 Savage          91             1
```

1.3.3. Top 10 Genres

Same as we did for Top 10 Songs, we group by `track_genre` and compute the average popularity of songs within each genre, arranged them in descending order and select the first i.e top 10 genres.

```
[1] "Top 10 Genres by Average Popularity:"
```

```
> print(top_genre)
```

```
# A tibble: 10 × 3
```

	track_genre	mean_popularity	song_count
	<chr>	<dbl>	<int>
1	pop-film	59.3	<u>1000</u>
2	k-pop	56.9	<u>1000</u>
3	chill	53.7	<u>1000</u>
4	sad	52.4	<u>1000</u>
5	grunge	49.6	<u>1000</u>
6	indian	49.5	<u>1000</u>
7	anime	48.8	<u>1000</u>
8	emo	48.1	<u>1000</u>
9	sertanejo	47.9	<u>1000</u>
10	pop	47.6	<u>1000</u>

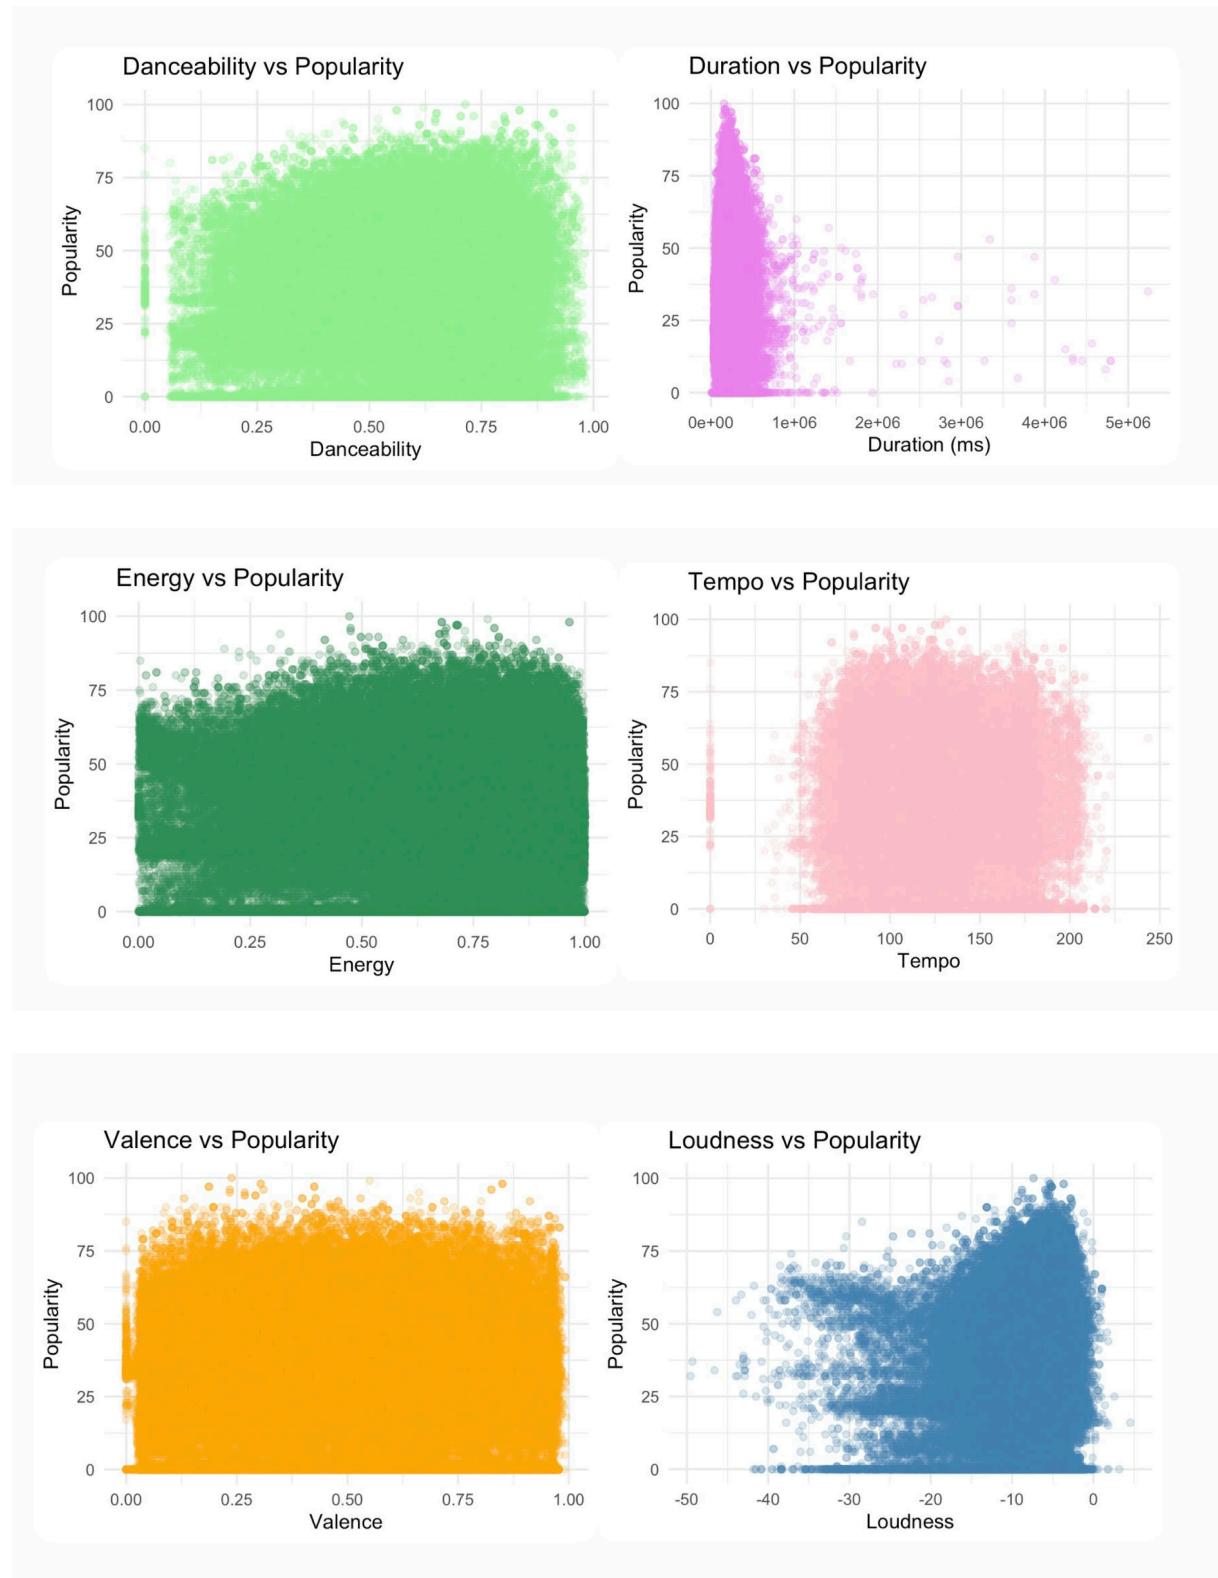

1.3.4. Song Popularity Bar - Plot

```
ggplot(spotify_data, aes(x = popularity)) +  
  geom_histogram(binwidth = 5, fill = "lightblue", color = "black") +  
  labs(title = "Distribution of Song Popularity", x = "Popularity", y = "Count") +  
  theme_minimal()
```

Let us analyze the relationship between song features and popularity using :

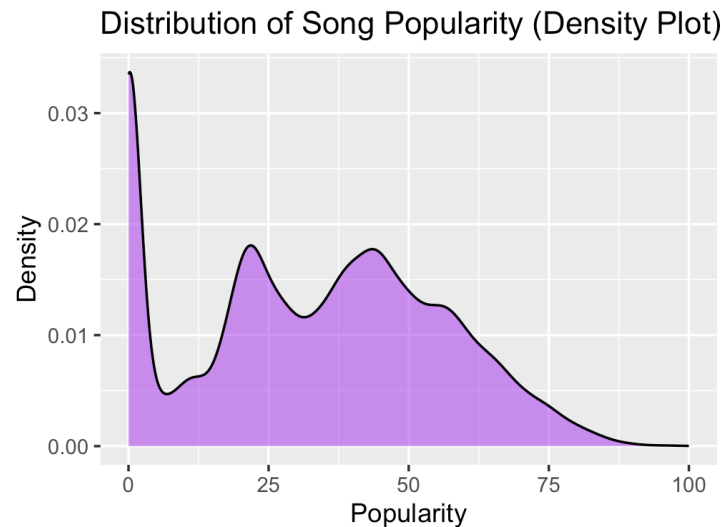

```
ggplot(spotify_data, aes(x = FEATURE, y = FEATURE)) +  
  geom_point(color = "lightgreen", alpha = 0.2) +  
  labs(title = "FEATURE vs Popularity", x = "FEATURE", y = "Popularity") +  
  theme_minimal()
```

Similarly we can find the feature vs popularity scatter plot for other numerical features too (acousticness, speechiness, instrumentalness, time_signature, etc...)

1.4. Visualization

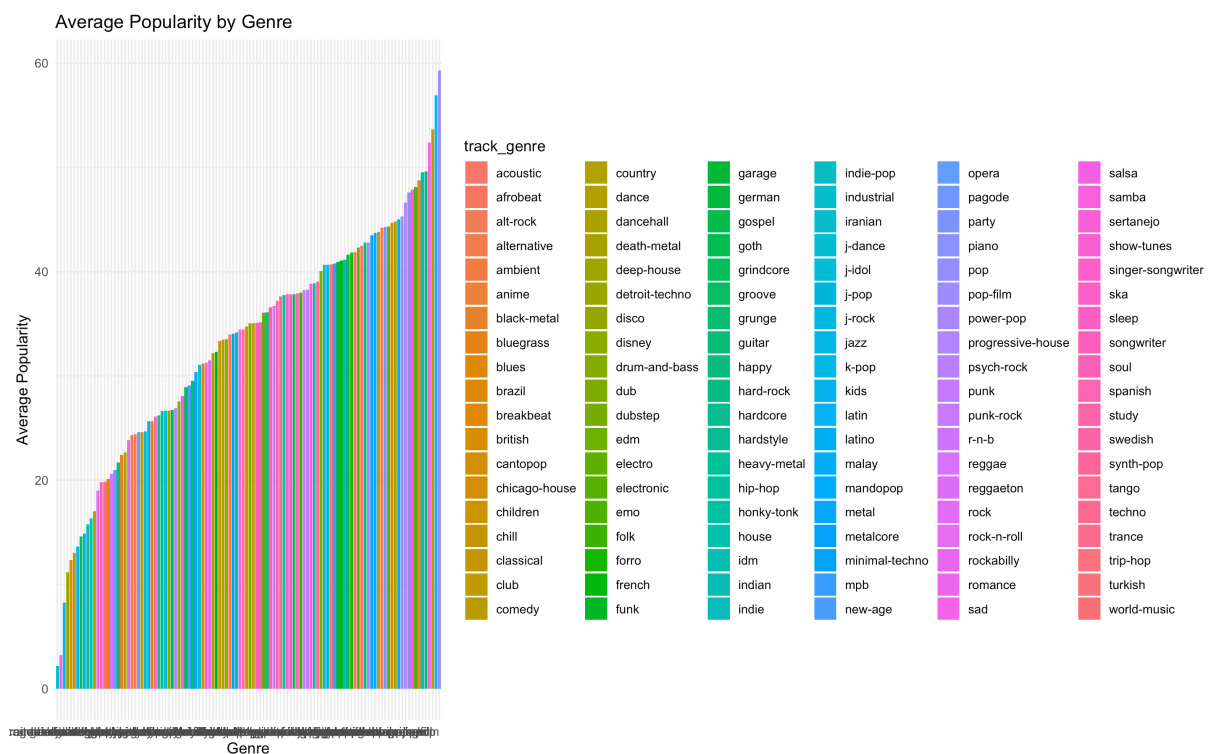

1.4.1. Density Plot of Distribution of Song Popularity (pdf)

1. Most songs have popularity scores clustered between 20 and 60.
2. There is a small number of songs with very high popularity scores near 90 or 100.
3. A sharp drop-off in the density curve might suggest that very few songs have very low popularity scores.

1.4.2. Genre popularity

`genre_avg_popularity` contains precomputed average popularity scores grouped by `track_genre` so we reorder the genres along the x-axis based on their respective average popularity values.

The below boxplots show variability in the feature's scores for each genre and whether certain genres will have consistently higher or lower danceability scores compared to others.

1.4.3. Danceability by Genre Boxplot

1.4.4. Energy by Genre Boxplot

1.4.5. Tempo by Genre Boxplot

1.5. Recommendation System

We shall implement a recommendation system based on both song popularity and genre.

1.5.1. Genre Method

If the selected method is `genre` the system :

- Filters for all songs that share the same genre as the input song.
- Excludes the input song itself from the recommendations.
- Selects the top 10 most popular songs within that genre.
- This logic assumes that listeners are likely to enjoy other songs that share a genre with their favorite.

```
if (method == "genre") {  
  # recommend songs with the same genre  
  recommendations <- spotify_data %>%  
    filter(track_genre == song_info$track_genre & track_name != song_name) %>%  
    select(track_name, track_genre, popularity) %>%  
    arrange(desc(popularity)) %>%  
    head(10)  
}
```

1.5.2. Popularity Method

If the selected method is `popularity` , then the system :

- Searches for songs whose popularity is similar to the input song's popularity.
- Excludes the input song itself from the recommendations.
- Selects the top 10 most popular songs from the filtered results.

```

} else if (method == "popularity") {
  #recommend songs with similar popularity
  recommendations <- spotify_data %>%
    filter(
      abs(popularity - song_info$popularity) < 5 & track_name != song_name
    ) %>%
    select(track_name, track_genre, popularity) %>%
    arrange(desc(popularity)) %>%
    head(10)
}

```

After processing either method, the function returns a dataframe recommendations (return(recommendations)) containing :

track_name : The name of the recommended song.

track_genre : The genre of the recommended song.

popularity : The popularity score of the recommended song.

For Example :

We input a song “N95” by Kendrick Lamar, the system will recommend 10 other songs that are in the same genre as “N95”.

```

recommendations_genre <- recommend_songs("N95", method = "genre")
print("Recommended Songs by Genre:")
print(recommendations_genre)

```

Or else, if we want similar popular songs to be recommended, then we use method = popularity When we input “White Ferrari” by Frank Ocean, it returns us songs that have a popularity score close to “White Ferrari” but are not the same song.

```

recommendations_popularity <- recommend_songs("White Ferrari", method =
"popularity")
print("Recommended Songs by Similar Popularity:")
print(recommendations_popularity)

```

Recom-
mended Songs by Similar Genre are :

track_name <chr>	track_genre <chr>	popularity <dbl>
1 Quevedo: Bzrp Music Sessions, Vol. 52	hip-hop	99
2 Super Freaky Girl	hip-hop	92
3 Jimmy Cooks (feat. 21 Savage)	hip-hop	91
4 STAR WALKIN' (League of Legends Worlds Anthem)	hip-hop	90
5 STAY (with Justin Bieber)	hip-hop	89
6 BILLIE EILISH.	hip-hop	89
7 Gangsta's Paradise	hip-hop	89
8 About Damn Time	hip-hop	89
9 WAIT FOR U (feat. Drake & Tems)	hip-hop	89
10 Without Me	hip-hop	88

Recommended Songs by Similar Genre are :

	track_name	track_genre	popularity
	<chr>	<chr>	<dbl>
1	Little Dark Age	alt-rock	83
2	You Get Me So High	alt-rock	83
3	Smells Like Teen Spirit	alt-rock	83
4	Shut Up and Dance	alt-rock	83
5	Numb	alternative	83
6	Little Dark Age	alternative	83
7	Shut Up and Dance	alternative	83
8	Smells Like Teen Spirit	alternative	83
9	You Get Me So High	alternative	83
10	Chop Suey!	alternative	83
